

Integration of Dallmeier Multifocal-Sensor Technology into Genetec™ Security Center

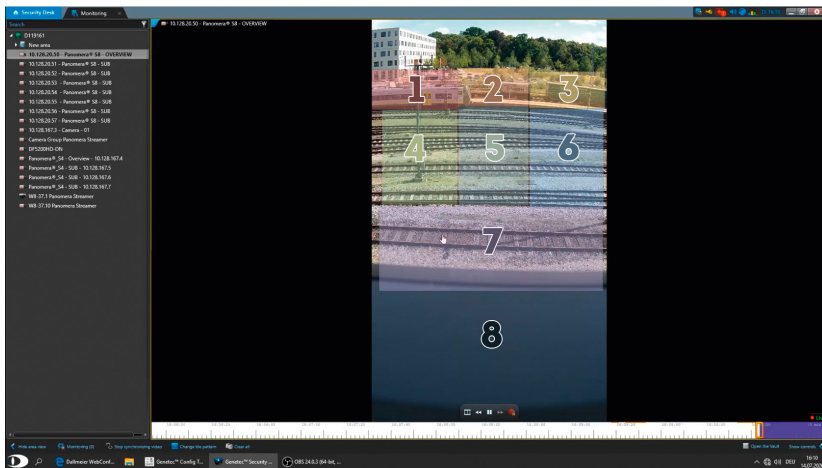

The patented Panomera® multifocal sensor (MFS) system has been developed especially for video coverage of wide areas and/or long distances. Due to the patented combination of multiple lenses with different focal lengths, enormous distances and expanses are captured in precisely pre-definable resolution quality in real time.

Panomera® can be easily integrated into Genetec™ Security Center, providing Genetec customers with the full benefit of this unique technology.

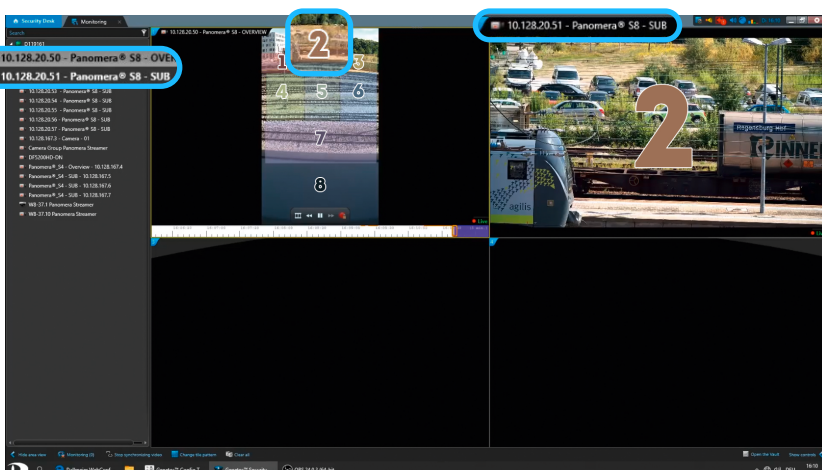

The Panomera® effect ensures that even distant objects are displayed with the same high resolution as objects in the front image area. The result is a much better optical control of even complex situations, less workload for the operator (factor 10 – 15) and massively reduced cost for infrastructure and operations.

Panomera® cameras can be integrated and used in Genetec Security Center via ONVIF and the “Visual Tracking” functionality with just a few steps.

Genetec™ Visual Tracking & Panomera®

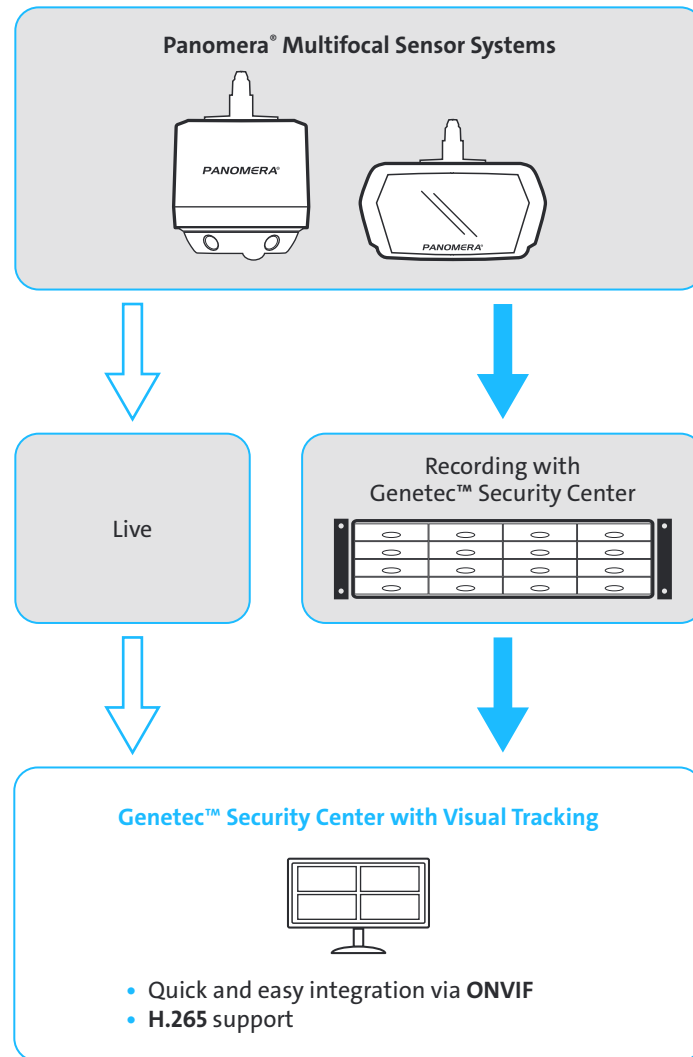

- Combine up to 8 different focus modules in one system
- Maximum **overview**
- Much better **control** and **situational awareness** in live-observation

- Any number of PTZ-like **detail views**
- **High resolution recording** of the entire scene for surveillance / investigation
- **Reduced TCO** for cameras & infrastructure
