

Harmonize iDRAC Plug-in for Milestone Systems XProtect® VMS

BCD's exclusive iDRAC Integration enables users to proactively monitor servers and predict hardware failures seamlessly through XProtect

Surveillance video is often mission critical which is why there has been strong demand for remote server management and health monitoring technologies from a single application. BCD has taken iDRAC (Integrated Dell Remote Access Controller) and tightly integrated it with Milestone XProtect so that hardware events, notifications and alarms are now presented within the VMS.

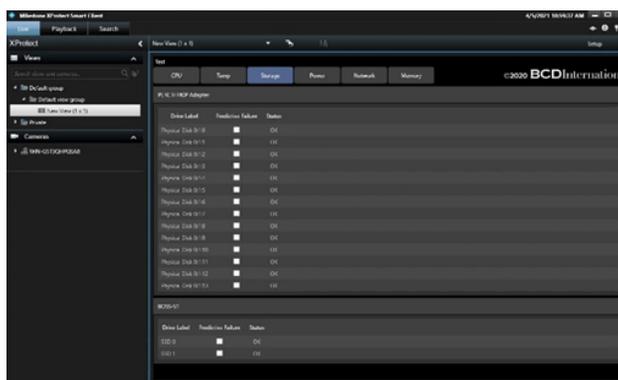

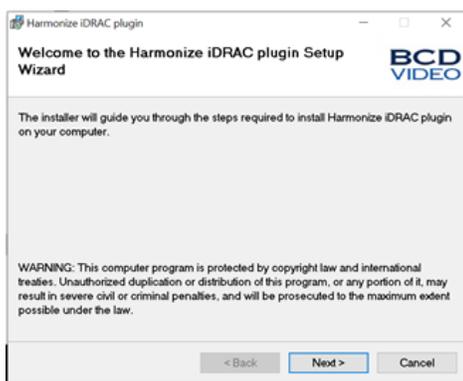

KEY FEATURES

With the Harmonize iDRAC plug-in, end-users and system integrators can monitor iDRAC features through XProtect, such as:

- Hard Disk Status
- Temperatures
- Fan Speed
- Power Supplies

HOW DOES IT WORK?

BCD's Harmonize software suite ingests the iDRAC API and listens for specific events, such as drive failure, and shares this critical system information in real-time to operators. The integration ultimately empowers end-users and system integrators to be ahead of failures and proactively manage any server crashes that may happen. It also gives them insight as to how well or poor the server resources are being utilized by being able to monitor central processing unit (CPU) and random access memory (RAM) consumption.
